

Global survey: Which crops hold the key for climate change adaptation?

Two Surveys are conducted by the Bioversity International and FAO targeting the agricultural research and development community interested in crop diversity or neglected and underutilized species (NUS).

The first survey aims to identify crops that are tolerant to stressful conditions to document the role of traditional crops in climate change adaptation:

The second survey, specifically targeting researchers, aims to investigate current capacity for NUS research and development:

<https://www.surveymonkey.com/s/NUSresearchcapacity>

The surveys are available in three languages: English, Spanish and French.

All responses are completely anonymous. The deadline for participation is February 7th, 2014.
